B-Tech (St - D) 05 Nosignment -1 Parit - A

B-Tech (CX - D)

1: 00 05 acts as an intermediary between hardware and D- It manages suscess (CPU, memory, I/O) efficiently.
- Burides essential surveices like process scheduling, file - Perovides essential security. The process scheduling, file systems, and showing 27 - Real Time operating System (1 - RTOS ensures deterministic (RTOS) is best. and timely exerposse, which is aucial for health monitoring.

- light weight, power - efficient, and can handle senson
inputs euliably. 3: - Avords Monolithic Kennel.

- Because it has all dervius in one large module, leading to: · large codebase and pook modularity.

· Nigher chance of bugs affecting the whole system.

· Difficult debugging and dower context switching. 4. - Refute - Os structure affects stability, feeformance, main tainability. and occurity. Vulnerability enhloits even if processes unn.

Structured design ensures modularity and scalibility. 5) PCB stories process state (eregisteurs, program Counter flags).

	· Analyzing PCB shows If sugisteus on states are to misinitialized during switch.
	Go minimalized during quith.
	and the training of the traini
(1)	Context quit-ching invalues:
1	Context switching involves.
A	· Sawing the avocent process state in Ets PCB- · Loading the next process's state ferom its PCB. · Updating & CPU registers, program counter and memory mappings.
115	- Undertine BCPU registers, program counter and
200	· Whating to CPU registers, program course
	memory mappings.
w	Use a blocking synchwonous system cut
. 31	- Blocking ensures the photon waits feet Ilo
	allocation to complete:
1000	Syncholonous ensures tasks proceed only after 110
	Synchronous ensures tasks proceed only after I/o- atten allocation Succeeds (ovoids reace conditions).

b) . The train account time (MT) = Completion 18 me - Arrival = Oforale · Waiting time (WT) = Twan around Time - Bever

FIFS

·W7: (0+5 +8+16) = 29 - 29/4 = 7-28 • TA7: (5+8+16+72) = 51 - 51/4 = 12-75

SJF

·WT: (3+0+ 14+8) = 25 -> 25 /4 = 6-25 · TA T: (8+3+ 22+14)=47 /47/4 = 11-275

· Completion: P1 = 16, P2=7, P3=20, P4=22

· WI = TAT - BUNGT

· TAT: (16+7+20+ 22)=65 =)65/4 = 16.25 · WT: (11+4+12+16) = 43 -943/4 = 10.75.

(a) -SJF gives lowest average waiting time and

Hence it balances thoughput and humanound best armong he three.

9) Cloud magnation OS architecture

Alchitecture:

· Microkeand - because:

· Minimal come increases of wenty.

· Spawices run in user mude impressory fault isolation

· Easy scalability by adding secules as modules.

Vistual Machines Pole:

· Brovide spolated envisonments for each server.

· Enable resource pooling and dynamic allocation.

· Simplify dystem manuagment and migration without

is) Smout home system acheduling

Perous Scheduling + TPC:

- Os assigns highen priority to witial turks

(Intrusion calcuts).

- lower priority for less critical tasks (light,
thermostat).

- IPC (21 gnals, message queues) ensures quick
communication between prioriesses.

Suitable algo:
Nowity Scheduling (Premptive) - ensures Crifical tasks

eun immedately.

• Earliest Deadline Fisht (EBF-) - good four eval-time

- Round Robin (you non- Oritical tasks 1 to ensure
